

Osteoarthritis

Osteoarthritis, also called, “wear and tear” arthritis, is the most common form of arthritic, affecting millions of people around the world. Osteoarthritis occurs when the protective cartilage on the ends of your bones wears down over time. While osteoarthritis can damage any joint in your body, the disorder most commonly affects joints in your hands, neck, lower back, knees and hips. Osteoarthritis gradually worsens with time, and no cure exists.

Risk factors include:

- High impact activity

Treatments that can relieve pain and improve function are:

- Bracing, assistive devices (canes, walkers)
- Non-Steroidal anti-inflammatory medications (Ibuprofen, Aleve, Advil, Motrin) as directed
- Physical Therapy to strengthen the muscles around the joint
- Injections (cortisone)
